Overview of the BIOMASS R package

D. Lamonica (IRD - AMAP)

GEO-TREES Panama Workshop

2026-03-15

Brief introduction

Mandatory
Forest inventory dataset
Optional
Plot's corner coordinates
Optional
CHM
Wood density data for all trees ?
no
yes
Need APG family/ order or correcting typo in taxonomy?
yes
no
correctTaxo
getWoodDensity
Tree height data for all trees ?
no
yes
Tree height data for some trees ?
no
yes
modelHD
retrieveH
Use Feldpausch region
Use Chave E
Are the coordinates reliable?
no
yes
check_plot_coord
divide_plot
(0.25 ha resolution)
Wood density
Diameter
Height
AGBmonteCarlo
AGB
and associated uncertainty
subplot_summary
divide_plot
subplot_summary
Plot based AGBD
and associated uncertainty
Spatialized AGBD
and associated uncertainty
CHM metric
and associated uncertainty
calibrate_model
predict_map
AGBD map
with pixel-based uncertainty
User data
Key biometric dimensions
Package function
Error propagation
OR symbol
Package output
Field plot based estimates
Remote sensing based estimates

CRAN R package

BIOMASS: Estimating Aboveground Biomass and Its Uncertainty in Tropical Forests

Contains functions for estimating above-ground biomass/carbon and its uncertainty in tropical forests. These functions allow to (1) retrieve and correct taxonomy, (2) estimate wood density and its uncertainty, (3) build height-diameter models, (4) manage tree and plot coordinates, (5) estimate above-ground biomass/carbon at stand level with associated uncertainty. To cite 'BIOMASS', please use citation('BIOMASS'). For more information, see Réjou-Méchain et al. (2017) <doi:10.1111/2041-210X.12753>.

Version:	2.2.4-1
Depends:	R (≥ 3.6)
Imports:	minpack.lm, jsonlite, methods, proj4, graphics, stats, utils, data.table (≥ 1.9.8), rappdirs, sf, terra, ggplot2
Suggests:	knitr, rmarkdown, prettydoc, testthat, vdiffr, curl, geodata, httr2, pkgdown, dplyr
Published:	2025-10-10
DOI:	10.32614/CRAN.package.BIOMASS
Author:	Maxime Réjou-Méchain [aut, dtc], Guillaume Cornu [aut], Dominique Lamonica [aut, cre], Arthur Bailly [aut], Arthur Pere [aut], Ariane Tanguy [aut], Jerome Chave [dtc], Ted Feldpausch [dtc], Philippe Verley [ctb], Camille Piponiot [aut], Bruno Hérault [aut]
Maintainer:	Dominique Lamonica <dominique.lamonica at ird.fr>
BugReports:	https://github.com/umr-amap/BIOMASS/issues/
License:	GPL-2
URL:	https://umr-amap.github.io/BIOMASS/, https://github.com/umr-amap/BIOMASS/
NeedsCompilation:	no
Citation:	BIOMASS citation info
Materials:	README, NEWS
CRAN checks:	BIOMASS results

Documentation:

Reference manual:	BIOMASS.html , BIOMASS.pdf
Vignettes:	Vignette BIOMASS (source, R code) Spatialize trees and forest stand metrics with BIOMASS (source, R code)

- Many contributors - some on specific features, others on the entire package

GitHub public repository

- Entire code accessible, issues open
- Developing version
- CI

Vignettes

- Tutorial for the entire pipeline divided in three main articles, applied on reduced Nouragues data

Shiny app - BIOMASSapp

- Estimate AGBD per subplot with uncertainties
- Spatialize stand metrics
- No map prediction

BIOMASSapp demonstration

Predict AGBD maps using inventory and LiDAR data

AGBD-LiDAR modelisation: proposed statistical framework

- geostatistical model with SPV-I/C (SPatially Varying Intercept/Coefficients) to integrate spatial correlation:
- $y(s) = (\alpha + \tilde{\alpha}(s)) + (\beta + \tilde{\beta}(s)) \times x(s) + \epsilon(s)$
  with $\tilde{\alpha}(s_1), ..., \tilde{\alpha}(s_n) \sim MVN(0, C_\alpha(s_i, s_j))$

Implementation in BIOMASS

- inference and predictions done using brms R package
- two functions: 1st calibrates the model with user plot and LiDAR data, 2nd predicts AGBD and its associated uncertainties over the full raster footprint provided by the user
- full continuity of the pipeline: the inputs of those functions are the outputs from the previous steps
- propagate all AGBD uncertainties from the previous steps, within Bayesian framework

Nouragues data example

SPV-C model

$log(y(s)) = (\beta + \tilde{\beta}(s)) \times log(x(s)) + \epsilon(s)$

with

- $y(s)$ AGBD 0.25ha for plot s : ajouter plot de l'agbd carré divisé + incertitudes
- $x(s)$ mean (or median) CHM 0.25ha for plot s : ajouter plot du raster + carré divisé
- $\tilde{\beta}(s_1), ..., \tilde{\beta}(s_n) \sim MVN(0, C_\beta(s_i, s_j))$

Outputs of CHM-AGBD model calibration

ici screen du model_fit + plot ppc

Map predictions

ici nouveau plot avec mean, sd, coeff var (à faire)

Validation

In the vignette we propose to calibrate on 70% of data, then validate on 30%, screen de la vignette

Future work, this week and later on

(à traduire)

- Quality check plus robuste avec du simple ou multidates
- Nouvelle allométrie générique globale de l'AGB
- Implementation d'une (ou de) nouvelle(s) approche(s) d'estimation de hauteur en absence de données terrain
- Prise en compte l'incertitude de positionnement sur individual trees
- Gestion de plots circulaires dans le pipeline de spatialisation des estimations
- Travail sur le modèle AGBD - LiDAR déjà développé dans BIOMASS V3.0 (flexibilité)
- Travail de recherche autour de la mise en place d'une nouvelle stratégie de modélisation AGB & LiDAR
- Temporal BIOMASS
